Mounting bracket for sensors

To ease the installation of the sensor we offer various brackets and angle plates as option. Please inform us about the specific type of sensor that you are using.

Manual sensor adjustment BKS.V

The manual sensor adjustment device allows easy adjustment of the sensor position on the steering frame. It consists of a very robust steel profile and a slide part. The profile is bolted to the steering frame. The sensor is mounted on the slide part.

You can now easily slide the sensor along the profile by opening the quick-release.

Please inform us about the specific type of steering frame and sensor that you are using.

The illustration shows the steel profile, the slide part and the assembled sensor.
